JavaScript

Bring Bootstrap's components to life with over a dozen custom jQuery plugins. Easily include them all, or one by one.

Overview

Individual or compiled

Plugins can be included individually (using Bootstrap's individual *.js files), or all at once (using bootstrap.js or the minified bootstrap.min.js).

Using the compiled JavaScript

Both bootstrap.js and bootstrap.min.js contain all plugins in a single file. Include only one.

Component data attributes

Don't use data attributes from multiple plugins on the same element. For example, a button cannot both have a tooltip and toggle a modal. To accomplish this, use a wrapping element.

Plugin dependencies

Some plugins and CSS components depend on other plugins. If you include plugins individually, make sure to check for these dependencies in the docs. Also note that all plugins depend on jQuery (this means jQuery must be included **before** the plugin files). Consult our bower.json (https://github.com/twbs/bootstrap/blob/v3.2.0/bower.json) to see which versions of jQuery are supported.

Data attributes

You can use all Bootstrap plugins purely through the markup API without writing a single line of JavaScript. This is Bootstrap's first-class API and should be your first consideration when using a plugin.

That said, in some situations it may be desirable to turn this functionality off. Therefore, we also provide the ability to disable the data attribute API by unbinding all events on the document namespaced with data-api. This looks like this:

```
$(document).off('.data-api')
```

Alternatively, to target a specific plugin, just include the plugin's name as a namespace along with the data-api namespace like this:

```
$(document).off('.alert.data-api')
```

Programmatic API

We also believe you should be able to use all Bootstrap plugins purely through the JavaScript API. All public APIs are single, chainable methods, and return the collection acted upon.

```
$('.btn.danger').button('toggle').addClass('fat')
```

All methods should accept an optional options object, a string which targets a particular method, or nothing (which initiates a plugin with default behavior):

Each plugin also exposes its raw constructor on a Constructor property:

\$.fn.popover.Constructor. If you'd like to get a particular plugin instance, retrieve it directly from an element: \$('[rel="popover"]').data('popover').

No conflict

Sometimes it is necessary to use Bootstrap plugins with other UI frameworks. In these circumstances, namespace collisions can occasionally occur. If this happens, you may call .noConflict on the plugin you wish to revert the value of.

```
var bootstrapButton = $.fn.button.noConflict() // return $.fn.button to
previously assigned value
$.fn.bootstrapBtn = bootstrapButton // give $().bootstrapBtn
the Bootstrap functionality
```

Events

Bootstrap provides custom events for most plugins' unique actions. Generally, these come in an infinitive and past participle form - where the infinitive (ex. show) is triggered at the start of an event, and its past participle form (ex. shown) is triggered on the completion of an action.

As of 3.0.0, all Bootstrap events are namespaced.

All infinitive events provide preventDefault functionality. This provides the ability to stop the execution of an action before it starts.

```
$('#myModal').on('show.bs.modal', function (e) {
  if (!data) return e.preventDefault() // stops modal from being shown
})
```

Third-party libraries

Bootstrap does not officially support third-party JavaScript libraries like Prototype or jQuery UI. Despite .noConflict and namespaced events, there may be compatibility problems that you need to fix on your own.

Transitions transition.js

About transitions

For simple transition effects, include transition.js once alongside the other JS files. If you're using the compiled (or minified) bootstrap.js, there is no need to include this—it's already there.

What's inside

Transition.js is a basic helper for transitionEnd events as well as a CSS transition emulator. It's used by the other plugins to check for CSS transition support and to catch hanging transitions.

Modals modal.js

Examples

Modals are streamlined, but flexible, dialog prompts with the minimum required functionality and smart defaults.

Overlapping modals not supported

Be sure not to open a modal while another is still visible. Showing more than one modal at a time requires custom code.

Modal markup placement

Always try to place a modal's HTML code in a top-level position in your document to avoid other components affecting the modal's appearance and/or functionality.

Mobile device caveats

There are some caveats regarding using modals on mobile devices. See our browser support docs (../getting-started/#support-fixed-position-keyboards) for details.

Static example

A rendered modal with header, body, and set of actions in the footer.

EXAMPLE

```
<div class="modal fade">
 <div class="modal-dialog">
    <div class="modal-content">
      <div class="modal-header">
        <button type="button" class="close" data-dismiss="modal"><span</pre>
aria-hidden="true">×</span><span class="sr-only">Close</span>
</button>
        <h4 class="modal-title">Modal title</h4>
      </div>
      <div class="modal-body">
        One fine body…
      </div>
      <div class="modal-footer">
        <button type="button" class="btn btn-default" data-</pre>
dismiss="modal">Close</button>
        <button type="button" class="btn btn-primary">Save changes/button>
     </div>
    </div><!-- /.modal-content -->
  </div><!-- /.modal-dialog -->
</div><!-- /.modal -->
```

Live demo

Toggle a modal via JavaScript by clicking the button below. It will slide down and fade in from the top of the page.

EXAMPLE

Launch demo modal

```
<!-- Button trigger modal -->
<button class="btn btn-primary btn-lg" data-toggle="modal" data-</pre>
target="#myModal">
  Launch demo modal
</button>
<!-- Modal -->
<div class="modal fade" id="myModal" tabindex="-1" role="dialog" aria-</pre>
labelledby="myModalLabel" aria-hidden="true">
 <div class="modal-dialog">
    <div class="modal-content">
      <div class="modal-header">
        <button type="button" class="close" data-dismiss="modal"><span</pre>
aria-hidden="true">×</span><span class="sr-only">Close</span>
</button>
        <h4 class="modal-title" id="myModalLabel">Modal title</h4>
      </div>
      <div class="modal-body">
        . . .
      </div>
      <div class="modal-footer">
        <button type="button" class="btn btn-default" data-</pre>
dismiss="modal">Close</button>
        <button type="button" class="btn btn-primary">Save changes/button>
      </div>
    </div>
 </div>
</div>
```

Make modals accessible

Be sure to add role="dialog" to .modal, aria-labelledby="myModalLabel" attribute to reference the modal title, and aria-hidden="true" to tell assistive technologies to skip the modal's DOM elements.

Additionally, you may give a description of your modal dialog with aria-describedby on .modal .

Embedding YouTube videos

Embedding YouTube videos in modals requires additional JavaScript not in Bootstrap to automatically stop playback and more. See this helpful Stack Overflow post (http://stackoverflow.com/questions/18622508/bootstrap-3-and-youtube-in-modal) for more information.

Optional sizes

Modals have two optional sizes, available via modifier classes to be placed on a .modal-dialog.

EXAMPLE

Large modal

Small modal

```
<!-- Large modal -->
<button class="btn btn-primary" data-toggle="modal" data-target=".bs-</pre>
example-modal-lg">Large modal</button>
<div class="modal fade bs-example-modal-lg" tabindex="-1" role="dialog"</pre>
aria-labelledby="myLargeModalLabel" aria-hidden="true">
 <div class="modal-dialog modal-lg">
    <div class="modal-content">
    </div>
  </div>
</div>
<!-- Small modal -->
<button class="btn btn-primary" data-toggle="modal" data-target=".bs-</pre>
example-modal-sm">Small modal</button>
<div class="modal fade bs-example-modal-sm" tabindex="-1" role="dialog"</pre>
aria-labelledby="mySmallModalLabel" aria-hidden="true">
 <div class="modal-dialog modal-sm">
    <div class="modal-content">
    </div>
 </div>
</div>
```

Remove animation

For modals that simply appear rather than fade in to view, remove the . fade class from your modal markup.

```
<div class="modal" tabindex="-1" role="dialog" aria-labelledby="" aria-
hidden="true">
    ...
</div>
```

Usage

The modal plugin toggles your hidden content on demand, via data attributes or JavaScript. It also adds .modal-open to the <body> to override default scrolling behavior and generates a .modal-backdrop to provide a click area for dismissing shown modals when clicking outside the modal.

Via data attributes

Activate a modal without writing JavaScript. Set data-toggle="modal" on a controller element, like a button, along with a data-target="#foo" or href="#foo" to target a specific modal to toggle.

<button type="button" data-toggle="modal" data-target="#myModal">Launch
modal

Via JavaScript

Call a modal with id myModal with a single line of JavaScript:

```
$('#myModal').modal(options)
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data-, as in data-backdrop="".

Name	type	default	description
backdrop	boolean or the string 'static'	true	Includes a modal-backdrop element. Alternatively, specify static for a backdrop which doesn't close the modal on click.
keyboard	boolean	true	Closes the modal when escape key is pressed
show	boolean	true	Shows the modal when initialized.
remote	path	false	If a remote URL is provided, content will be loaded one time via jQuery's load method and injected into the .modal-content div. If you're using the data-api, you may alternatively use the href attribute to specify the remote source. An example of this is shown below:

```
<a data-toggle="modal"
href="remote.html" data-
target="#modal">Click me</a>
```

Methods

.modal(options)

Activates your content as a modal. Accepts an optional options object.

```
$('#myModal').modal({
  keyboard: false
})
```

.modal('toggle')

Manually toggles a modal. Returns to the caller before the modal has actually been shown or hidden (i.e. before the shown.bs.modal or hidden.bs.modal event occurs).

```
$('#myModal').modal('toggle')
```

.modal('show')

Manually opens a modal. Returns to the caller before the modal has actually been shown (i.e. before the shown.bs.modal event occurs).

```
$('#myModal').modal('show')
```

.modal('hide')

Manually hides a modal. Returns to the caller before the modal has actually been hidden (i.e. before the hidden.bs.modal event occurs).

```
$('#myModal').modal('hide')
```

Events

Bootstrap's modal class exposes a few events for hooking into modal functionality.

Event Type	Description
show.bs.modal	This event fires immediately when the show instance method is called. If caused by a click, the clicked element is available as the relatedTarget property of the event.
shown.bs.modal	This event is fired when the modal has been made visible to the user (will wait for CSS transitions to complete). If caused by a click, the clicked element is available as the relatedTarget property of the event.

hide.bs.modal	This event is fired immediately when the hide instance method has been called.	
hidden.bs.modal	This event is fired when the modal has finished being hidden from the user (will wait for CSS transitions to complete).	
loaded.bs.modal	This event is fired when the modal has loaded content using the remote option.	

```
$('#myModal').on('hidden.bs.modal', function (e) {
  // do something...
})
```

Dropdowns dropdown.js

Examples

Add dropdown menus to nearly anything with this simple plugin, including the navbar, tabs, and pills.

Within a navbar

EXAMPLE

Within pills

EXAMPLE

Regular link Dropdown → Dropdown 2 → Dropdown 3 →

Usage

Via data attributes or JavaScript, the dropdown plugin toggles hidden content (dropdown menus) by toggling the .open class on the parent list item. When opened, the plugin also adds .dropdown-backdrop as a click area for closing dropdown menus when clicking outside the menu. Note: The data-toggle=dropdown attribute is relied on for closing dropdown menus at an application level, so it's a good idea to always use it.

Via data attributes

Add data-toggle="dropdown" to a link or button to toggle a dropdown.

To keep URLs intact, use the data-target attribute instead of href="#".

Via JavaScript

Call the dropdowns via JavaScript:

```
$('.dropdown-toggle').dropdown()
```

```
data-toggle="dropdown" still required
```

Regardless of whether you call your dropdown via JavaScript or instead use the data-api, data-toggle="dropdown" is always required to be present on the dropdown's trigger element.

Options

None

Methods

\$().dropdown('toggle')

Toggles the dropdown menu of a given navbar or tabbed navigation.

Events

All dropdown events are fired at the .dropdown-menu 's parent element.

Event Type	Description	
show.bs.dropdown This event fires immediately when the show instance method is ca toggling anchor element is available as the relatedTarget properties of the event.		
shown.bs.dropdown	This event is fired when the dropdown has been made visible to the user (will wait for CSS transitions, to complete). The toggling anchor element is available as the relatedTarget property of the event.	
hide.bs.dropdown	This event is fired immediately when the hide instance method has been called. The toggling anchor element is available as the relatedTarget property of the event.	
hidden.bs.dropdown	This event is fired when the dropdown has finished being hidden from the user (will wait for CSS transitions, to complete). The toggling anchor element is available as the relatedTarget property of the event.	

```
$('#myDropdown').on('show.bs.dropdown', function () {
  // do something...
})
```

ScrollSpy scrollspy.js

Example in navbar

The ScrollSpy plugin is for automatically updating nav targets based on scroll position. Scroll the area below the navbar and watch the active class change. The dropdown sub items will be highlighted as well.

EXAMPLE

@fat

Ad leggings keytar, brunch id art party dolor labore. Pitchfork yr enim lo-fi before they sold out qui. Tumblr farm-to-table bicycle rights whatever. Anim keffiyeh carles cardigan. Velit seitan mcsweeney's photo booth 3 wolf moon irure. Cosby sweater lomo jean shorts, williamsburg hoodie minim qui you probably haven't heard of them et cardigan trust fund culpa biodiesel wes anderson aesthetic. Nihil tattooed accusamus, cred irony biodiesel keffiyeh artisan ullamco consequat.

@mdo

Veniam marfa mustache skateboard, adipisicing fugiat velit pitchfork beard. Freegan beard aliqua

Usage

Requires relative positioning

No matter the implementation method, scrollspy requires the use of position: relative; on the element you're spying on. In most cases this is the <body>.

Via data attributes

To easily add scrollspy behavior to your topbar navigation, add data-spy="scroll" to the element you want to spy on (most typically this would be the <body>). Then add the data-target attribute with the ID or class of the parent element of any Bootstrap .nav component.

```
body {
  position: relative;
}
```

Via JavaScript

After adding position: relative; in your CSS, call the scrollspy via JavaScript:

```
$('body').scrollspy({ target: '.navbar-example' })
```

Resolvable ID targets required

Navbar links must have resolvable id targets. For example, a home must correspond to something in the DOM like <div id="home"></div>.

Non-: visible target elements ignored

Target elements that are not :visible according to jQuery (http://api.jquery.com/visible-selector/) will be ignored and their corresponding nav items will never be highlighted.

Methods

.scrollspy('refresh')

When using scrollspy in conjunction with adding or removing of elements from the DOM, you'll need to call the refresh method like so:

```
$('[data-spy="scroll"]').each(function () {
  var $spy = $(this).scrollspy('refresh')
})
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data-, as in data-offset="".

Name	type	default	description
offset	number	10	Pixels to offset from top when calculating position of scroll.

Events

Event Type	Description
activate.bs.scrollspy	This event fires whenever a new item becomes activated by the scrollspy.

```
$('#myScrollspy').on('activate.bs.scrollspy', function () {
  // do something...
})
```

Togglable tabs tab.js

Example tabs

Add quick, dynamic tab functionality to transition through panes of local content, even via dropdown menus.

EXAMPLE

Home Profile Dropdown ▼

Raw denim you probably haven't heard of them jean shorts Austin. Nesciunt tofu stumptown aliqua, retro synth master cleanse. Mustache cliche tempor, williamsburg carles vegan helvetica. Reprehenderit butcher retro keffiyeh dreamcatcher synth. Cosby sweater eu banh mi, qui irure terry richardson ex squid. Aliquip placeat salvia cillum iphone. Seitan aliquip quis cardigan american apparel, butcher voluptate nisi qui.

Extends tabbed navigation

This plugin extends the tabbed navigation component (../components/#nav-tabs) to add tabbable areas.

Usage

Enable tabbable tabs via JavaScript (each tab needs to be activated individually):

```
$('#myTab a').click(function (e) {
  e.preventDefault()
  $(this).tab('show')
})
```

You can activate individual tabs in several ways:

```
$('#myTab a[href="#profile"]').tab('show') // Select tab by name
$('#myTab a:first').tab('show') // Select first tab
$('#myTab a:last').tab('show') // Select last tab
$('#myTab li:eq(2) a').tab('show') // Select third tab (0-indexed)
```

Markup

You can activate a tab or pill navigation without writing any JavaScript by simply specifying data-toggle="tab" or data-toggle="pill" on an element. Adding the nav and nav-tabs classes to the tab ul will apply the Bootstrap tab styling (../components/#nav-tabs), while adding the nav and nav-pills classes will apply pill styling (../components/#nav-pills).

```
<!-- Nav tabs -->
<a href="#home" role="tab" data-</pre>
toggle="tab">Home</a>
 <a href="#profile" role="tab" data-toggle="tab">Profile</a>
 <a href="#messages" role="tab" data-toggle="tab">Messages</a>
 <a href="#settings" role="tab" data-toggle="tab">Settings</a>
<!-- Tab panes -->
<div class="tab-content">
 <div class="tab-pane active" id="home">...</div>
 <div class="tab-pane" id="profile">...</div>
 <div class="tab-pane" id="messages">...</div>
 <div class="tab-pane" id="settings">...</div>
</div>
```

Fade effect

To make tabs fade in, add .fade to each .tab-pane . The first tab pane must also have .in to properly fade in initial content.

```
<div class="tab-content">
    <div class="tab-pane fade in active" id="home">...</div>
    <div class="tab-pane fade" id="profile">...</div>
    <div class="tab-pane fade" id="messages">...</div>
    <div class="tab-pane fade" id="settings">...</div>
</div>
```

Methods

\$().tab

Activates a tab element and content container. Tab should have either a data-target or an href targeting a container node in the DOM.

```
<a href="#home" role="tab" data-</pre>
toggle="tab">Home</a>
 <a href="#profile" role="tab" data-toggle="tab">Profile</a>
 <a href="#messages" role="tab" data-toggle="tab">Messages</a>
 <a href="#settings" role="tab" data-toggle="tab">Settings</a>
<div class="tab-content">
 <div class="tab-pane active" id="home">...</div>
 <div class="tab-pane" id="profile">...</div>
 <div class="tab-pane" id="messages">...</div>
 <div class="tab-pane" id="settings">...</div>
</div>
<script>
 $(function () {
   $('#myTab a:last').tab('show')
 })
</script>
```

Events

Event Type	Description
show.bs.tab	This event fires on tab show, but before the new tab has been shown. Use event.target and event.relatedTarget to target the active tab and the previous active tab (if available) respectively.
shown.bs.tab	This event fires on tab show after a tab has been shown. Use event.target and event.relatedTarget to target the active tab and the previous active tab (if available) respectively.

```
$('a[data-toggle="tab"]').on('shown.bs.tab', function (e) {
  e.target // activated tab
  e.relatedTarget // previous tab
})
```

Tooltips tooltip.js

Examples

Inspired by the excellent jQuery.tipsy plugin written by Jason Frame; Tooltips are an updated version, which don't rely on images, use CSS3 for animations, and data-attributes for local title storage.

Hover over the links below to see tooltips:

EXAMPLE

Tight pants next level keffiyeh you probably haven't heard of them. Photo booth beard raw denim letterpress vegan messenger bag stumptown. Farm-to-table seitan, mcsweeney's fixie sustainable quinoa 8-bit american apparel have a terry richardson vinyl chambray. Beard stumptown, cardigans banh mi lomo thundercats. Tofu biodiesel williamsburg marfa, four loko mcsweeney's cleanse vegan chambray. A really ironic artisan whatever keytar, scenester farm-to-table banksy Austin twitter handle freegan cred raw denim single-origin coffee viral.

Four directions

EXAMPLE

<button type="button" class="btn btn-default" data-toggle="tooltip" dataplacement="left" title="Tooltip on left">Tooltip on left</button>

<button type="button" class="btn btn-default" data-toggle="tooltip" dataplacement="top" title="Tooltip on top">Tooltip on top</button>

<button type="button" class="btn btn-default" data-toggle="tooltip" dataplacement="bottom" title="Tooltip on bottom">Tooltip on bottom</br/>/button>

<button type="button" class="btn btn-default" data-toggle="tooltip" dataplacement="right" title="Tooltip on right">Tooltip on right/button>

Opt-in functionality

For performance reasons, the Tooltip and Popover data-apis are opt-in, meaning **you must initialize them yourself**.

Tooltips in button groups and input groups require special setting

When using tooltips on elements within a .btn-group or an .input-group, you'll have to specify the option container: 'body' (documented below) to avoid unwanted side effects (such as the element growing wider and/or losing its rounded corners when the tooltip is triggered).

Don't try to show tooltips on hidden elements

Invoking (...) tooltip('show') when the target element is display: none; will cause the tooltip to be incorrectly positioned.

Tooltips on disabled elements require wrapper elements

To add a tooltip to a disabled or .disabled element, put the element inside of a <div> and apply the tooltip to that <div> instead.

Usage

The tooltip plugin generates content and markup on demand, and by default places tooltips after their trigger element.

Trigger the tooltip via JavaScript:

```
$('#example').tooltip(options)
```

Markup

The required markup for a tooltip is only a data attribute and title on the HTML element you wish to have a tooltip. The generated markup of a tooltip is rather simple, though it does require a position (by default, set to top by the plugin).

Multiple-line links

Sometimes you want to add a tooltip to a hyperlink that wraps multiple lines. The default behavior of the tooltip plugin is to center it horizontally and vertically. Add white-space: nowrap; to your anchors to avoid this.

```
<!-- HTML to write -->
<a href="#" data-toggle="tooltip" title="Some tooltip text!">Hover over
me</a>
<!-- Generated markup by the plugin -->
<div class="tooltip top" role="tooltip">
        <div class="tooltip-arrow"></div>
        <div class="tooltip-inner">
            Some tooltip text!
        </div>
</div>
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data- as in data-animation="".

Name	Туре	Default	Description
animation	boolean	true	Apply a CSS fade transition to the tooltip
container	string false	false	Appends the tooltip to a specific element. Example: container: 'body'. This option is particularly useful in that it allows you to position the tooltip in the flow of the document near the triggering element - which will prevent the tooltip from floating away from the triggering element during a window resize.
delay	number object	0	Delay showing and hiding the tooltip (ms) - does not apply to manual trigger type
			If a number is supplied, delay is applied to both hide/show
			Object structure is: delay: { show: 500, hide: 100 }
html	boolean	false	Insert HTML into the tooltip. If false, jQuery's text method will be used to insert content into the DOM. Use text if you're worried about XSS attacks.
placement	string function	'top'	How to position the tooltip - top bottom left right auto. When "auto" is specified, it will dynamically reorient the tooltip. For example, if placement is "auto left", the tooltip will display to the left when possible, otherwise it will display right.
selector	string	false	If a selector is provided, tooltip objects will be delegated to the specified targets. In practice, this is used to enable dynamic HTML content to have tooltips added. See this (https://github.com/twbs/bootstrap/issues/4215) and an informative example (http://jsfiddle.net/fScua/).
template	string	<pre>'<div class="tooltip" role="tooltip"> </div></pre>	

		•	·
		arrow"> <div class="tooltip- inner"></div> '	.tooltip-arrow will become the tooltip's arrow. The outermost wrapper element should have the .tooltip class.
title	string function	п	Default title value if title attribute isn't present
trigger	string	'hover focus'	How tooltip is triggered - click hover focus manual. You may pass multiple triggers; separate them with a space.
viewport	string object	{ selector: 'body', padding: 0 }	Keeps the tooltip within the bounds of this element. Example: viewport: '#viewport' or { selector: '#viewport', padding: 0 }

Data attributes for individual tooltips

Options for individual tooltips can alternatively be specified through the use of data attributes, as explained above.

Methods

\$().tooltip(options)

Attaches a tooltip handler to an element collection.

.tooltip('show')

Reveals an element's tooltip.

```
$('#element').tooltip('show')
```

.tooltip('hide')

Hides an element's tooltip.

```
$('#element').tooltip('hide')
```

.tooltip('toggle')

Toggles an element's tooltip.

```
$('#element').tooltip('toggle')
```

.tooltip('destroy')

Hides and destroys an element's tooltip.

```
$('#element').tooltip('destroy')
```

Events

Event Type	Description
show.bs.tooltip	This event fires immediately when the show instance method is called.
shown.bs.tooltip	This event is fired when the tooltip has been made visible to the user (will wait for CSS transitions to complete).
hide.bs.tooltip	This event is fired immediately when the hide instance method has been called.
hidden.bs.tooltip	This event is fired when the tooltip has finished being hidden from the user (will wait for CSS transitions to complete).

```
$('#myTooltip').on('hidden.bs.tooltip', function () {
  // do something...
})
```

Popovers popover.js

Examples

Add small overlays of content, like those on the iPad, to any element for housing secondary information.

Plugin dependency

Popovers require the tooltip plugin to be included in your version of Bootstrap.

Opt-in functionality

For performance reasons, the Tooltip and Popover data-apis are opt-in, meaning **you must initialize them yourself**.

Popovers in button groups and input groups require special setting

When using popovers on elements within a .btn-group or an .input-group, you'll have to specify the option container: 'body' (documented below) to avoid unwanted side effects (such as the element growing wider and/or losing its rounded corners when the popover is triggered).

Don't try to show popovers on hidden elements

Invoking \$(...).popover('show') when the target element is display: none; will cause the popover to be incorrectly positioned.

Popovers on disabled elements require wrapper elements

To add a popover to a disabled or .disabled element, put the element inside of a <div> and apply the popover to that <div> instead.

Static popover

Four options are available: top, right, bottom, and left aligned.

EXAMPLE

Popover top

Sed posuere consectetur est at lobortis. Aenean eu leo quam. Pellentesque ornare sem lacinia quam venenatis vestibulum.

Popover bottom

Sed posuere consectetur est at lobortis. Aenean eu leo quam. Pellentesque ornare sem lacinia quam venenatis vestibulum.

Popover right

Sed posuere consectetur est at lobortis. Aenean eu leo quam. Pellentesque ornare sem lacinia quam venenatis vestibulum.

Popover left

Sed posuere consectetur est at lobortis. Aenean eu leo quam. Pellentesque ornare sem lacinia quam venenatis vestibulum.

Live demo

EXAMPLE

Click to toggle popover

<button type="button" class="btn btn-lg btn-danger" data-toggle="popover"
title="Popover title" data-content="And here's some amazing content. It's
very engaging. Right?">Click to toggle popover</button>

Four directions

EXAMPLE

Popover on left Popover on right Popover on top Popover on bottom <button type="button" class="btn btn-default" data-container="body" data-</pre> toggle="popover" data-placement="left" data-content="Vivamus sagittis lacus vel augue laoreet rutrum faucibus."> Popover on left </button> <button type="button" class="btn btn-default" data-container="body" data-</pre> toggle="popover" data-placement="top" data-content="Vivamus sagittis lacus vel augue laoreet rutrum faucibus."> Popover on top </button> <button type="button" class="btn btn-default" data-container="body" data-</pre> toggle="popover" data-placement="bottom" data-content="Vivamus sagittis lacus vel augue laoreet rutrum faucibus."> Popover on bottom </button> <button type="button" class="btn btn-default" data-container="body" data-</pre> toggle="popover" data-placement="right" data-content="Vivamus sagittis lacus vel augue laoreet rutrum faucibus."> Popover on right </button>

Dismiss on next click

Use the focus trigger to dismiss popovers on the next click that the user makes.

EXAMPLE

Dismissible popover

<button type="button" class="btn btn-lg btn-danger popover-dismiss" datatoggle="popover" title="Dismissible popover" data-content="And here's some
amazing content. It's very engaging. Right?">Dismissible popover</button>

```
$('.popover-dismiss').popover({
  trigger: 'focus'
})
```

Multiple-line links

Sometimes you want to add a popover to a hyperlink that wraps multiple lines. The default behavior of the popover plugin is to center it horizontally and vertically. Add white-space: nowrap; to your anchors to avoid this.

Usage

Enable popovers via JavaScript:

```
$('#example').popover(options)
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data-, as in data-animation="".

Name	Туре	Default	Description
animation	boolean	true	Apply a CSS fade transition to the popover
container	string false	false	Appends the popover to a specific element. Example: container: 'body'. This option is particularly useful in that it allows you to position the popover in the flow of the document near the triggering element - which will prevent the popover from floating away from the triggering element during a window resize.
content	string function	11	Default content value if data-content attribute isn't present. If a function is given, it will be called with 1 argument, which is the element that the popover is attached to.
delay	number	0	

	object		Delay showing and hiding the popover (ms) - does not apply to manual trigger type
			If a number is supplied, delay is applied to both hide/show
			Object structure is: delay: { show: 500, hide: 100 }
html	boolean	false	Insert HTML into the popover. If false, jQuery's text method will be used to insert content into the DOM. Use text if you're worried about XSS attacks.
placement	string function	'right'	How to position the popover - top bottom left right auto. When "auto" is specified, it will dynamically reorient the popover. For example, if placement is "auto left", the popover will display to the left when possible, otherwise it will display right.
selector	string	false	If a selector is provided, popover objects will be delegated to the specified targets. In practice, this is used to enable dynamic HTML content to have popovers added. See this (https://github.com/twbs/bootstrap/issues/4215) and an informative example (http://jsfiddle.net/fScua/).
template	string	<pre>'<div class="popover" role="tooltip"> <div class="arrow"> </div><h3 class="popover- title"></h3> <div class="popover- content"></div> </div>'</pre>	Base HTML to use when creating the popover. The popover's title will be injected into the .popover-title. The popover's content will be injected into the .popover-content. .arrow will become the popover's arrow. The outermost wrapper element should have the .popover class.
title	string function	11	Default title value if title attribute isn't present
trigger	string	'click'	How popover is triggered - click hover focus manual. You may pass multiple triggers;

			separate them with a space.
viewport	string object	{ selector: 'body', padding: 0 }	Keeps the popover within the bounds of this element. Example: viewport: '#viewport' or { selector: '#viewport', padding: 0 }

Data attributes for individual popovers

Options for individual popovers can alternatively be specified through the use of data attributes, as explained above.

Methods

\$().popover(options)

Initializes popovers for an element collection.

.popover('show')

Reveals an elements popover.

```
$('#element').popover('show')
```

.popover('hide')

Hides an elements popover.

```
$('#element').popover('hide')
```

.popover('toggle')

Toggles an elements popover.

```
$('#element').popover('toggle')
```

.popover('destroy')

Hides and destroys an element's popover.

```
$('#element').popover('destroy')
```

Events

Event Type	Description
show.bs.popover	This event fires immediately when the show instance method is called.
shown.bs.popover	This event is fired when the popover has been made visible to the user (will

	wait for CSS transitions to complete).
hide.bs.popover	This event is fired immediately when the hide instance method has been called.
hidden.bs.popover	This event is fired when the popover has finished being hidden from the user (will wait for CSS transitions to complete).

```
$('#myPopover').on('hidden.bs.popover', function () {
  // do something...
})
```

Alert messages alert.js

Example alerts

Add dismiss functionality to all alert messages with this plugin.

EXAMPLE

Holy guacamole! Best check yo self, you're not looking too good.

EXAMPLE

Oh snap! You got an error!

Change this and that and try again. Duis mollis, est non commodo luctus, nisi erat porttitor ligula, eget lacinia odio sem nec elit. Cras mattis consectetur purus sit amet fermentum.

Take this action

Or do this

Usage

Enable dismissal of an alert via JavaScript:

```
$(".alert").alert()
```

Markup

Just add data-dismiss="alert" to your close button to automatically give an alert close functionality.

```
<button type="button" class="close" data-dismiss="alert"><span aria-
hidden="true">×</span><span class="sr-only">Close</span></button>
```

Methods

\$().alert()

Wraps all alerts with close functionality. To have your alerts animate out when closed, make sure they have the .fade and .in class already applied to them.

.alert('close')

Closes an alert.

```
$(".alert").alert('close')
```

Events

Bootstrap's alert class exposes a few events for hooking into alert functionality.

Event Type	Description
close.bs.alert	This event fires immediately when the close instance method is called.
closed.bs.alert	This event is fired when the alert has been closed (will wait for CSS transitions to complete).

```
$('#my-alert').on('closed.bs.alert', function () {
  // do something...
})
```

Buttons button.js

Example uses

Do more with buttons. Control button states or create groups of buttons for more components like toolbars.

Stateful

Add data-loading-text="Loading..." to use a loading state on a button.

EXAMPLE

Loading state

```
<button type="button" id="loading-example-btn" data-loading-
text="Loading..." class="btn btn-primary">
   Loading state
</button>
<script>
   $('#loading-example-btn').click(function () {
    var btn = $(this)
    btn.button('loading')
    $.ajax(...).always(function () {
       btn.button('reset')
    });
});
</script>
```

Single toggle

Add data-toggle="button" to activate toggling on a single button.

EXAMPLE

Single toggle

<button type="button" class="btn btn-primary" data-toggle="button">Single
toggle</button>

Checkbox

Add data-toggle="buttons" to a group of checkboxes for checkbox style toggling on btn-group.

Pre-checked options need .active

For pre-checked options, you must add the .active class to the input's label yourself.

EXAMPLE

Option 1 (pre-checked) Option 2 Option 3

```
<div class="btn-group" data-toggle="buttons">
    <label class="btn btn-primary active">
        <input type="checkbox" checked> Option 1 (pre-checked)
    </label>
    <label class="btn btn-primary">
        <input type="checkbox"> Option 2
    </label>
    <label class="btn btn-primary">
        <input type="checkbox"> Option 3
        </label>
</div>
```

Radio

Add data-toggle="buttons" to a group of radio inputs for radio style toggling on btn-group.

Preselected options need .active

For preselected options, you must add the .active class to the input's label yourself.

EXAMPLE

```
Option 1 (preselected) Option 2 Option 3
```

Usage

Enable buttons via JavaScript:

```
$('.btn').button()
```

Markup

Data attributes are integral to the button plugin. Check out the example code below for the various markup types.

Options

None

Methods

\$().button('toggle')

Toggles push state. Gives the button the appearance that it has been activated.

Auto toggling

You can enable auto toggling of a button by using the data-toggle attribute.

```
<button type="button" class="btn btn-primary" data-toggle="button">...
</button>
```

\$().button('loading')

Sets button state to loading - disables button and swaps text to loading text. Loading text should be defined on the button element using the data attribute data-loading-text.

```
<button id="loading-example-btn" type="button" class="btn btn-primary"
data-loading-text="loading stuff...">...</button>
<script>
    $('#loading-example-btn').click(function () {
    var btn = $(this)
    btn.button('loading')
    $.ajax(...).always(function () {
        btn.button('reset')
     });
};
</script>
```

Cross-browser compatibility

Firefox persists form control states across page loads (https://github.com/twbs/bootstrap/issues/793). A workaround for this is to use autocomplete="off".

\$().button('reset')

Resets button state - swaps text to original text.

\$().button(string)

Resets button state - swaps text to any data defined text state.

```
<button type="button" class="btn btn-primary" data-complete-
text="finished!" >...</button>
<script>
  $('.btn').button('complete')
</script>
```

Collapse collapse.js

About

Get base styles and flexible support for collapsible components like accordions and navigation.

Plugin dependency

Collapse requires the transitions plugin to be included in your version of Bootstrap.

Example accordion

Using the collapse plugin, we built a simple accordion by extending the panel component.

EXAMPLE

Collapsible Group Item #1

Anim pariatur cliche reprehenderit, enim eiusmod high life accusamus terry richardson ad squid. 3 wolf moon officia aute, non cupidatat skateboard dolor brunch. Food truck quinoa nesciunt laborum eiusmod. Brunch 3 wolf moon tempor, sunt aliqua put a bird on it squid single-origin coffee nulla assumenda shoreditch et. Nihil anim keffiyeh helvetica, craft beer labore wes anderson cred nesciunt sapiente ea proident. Ad vegan excepteur butcher vice lomo. Leggings occaecat craft beer farm-to-table, raw denim aesthetic synth nesciunt you probably haven't heard of them accusamus labore sustainable VHS.

Collapsible Group Item #2

Collapsible Group Item #3

Anim pariatur cliche reprehenderit, enim eiusmod high life accusamus terry richardson ad squid. 3 wolf moon officia aute, non cupidatat skateboard dolor brunch. Food truck quinoa nesciunt laborum eiusmod. Brunch 3 wolf moon tempor, sunt aliqua put a bird on it squid single-origin coffee nulla assumenda shoreditch et. Nihil anim keffiyeh helvetica, craft beer labore wes anderson cred nesciunt sapiente ea proident. Ad vegan excepteur butcher vice lomo. Leggings occaecat craft beer farm-to-table, raw denim aesthetic synth nesciunt you probably haven't heard of them accusamus labore sustainable VHS.

Anim pariatur cliche reprehenderit, enim eiusmod high life accusamus terry richardson ad squid. 3 wolf moon officia aute, non cupidatat skateboard dolor brunch. Food truck quinoa nesciunt laborum eiusmod. Brunch 3 wolf moon tempor, sunt aliqua put a bird on it squid single-origin coffee nulla assumenda shoreditch et. Nihil anim keffiyeh helvetica, craft beer labore wes anderson cred nesciunt sapiente ea proident. Ad vegan excepteur butcher vice lomo. Leggings occaecat craft beer farm-to-table, raw denim aesthetic synth nesciunt you probably haven't heard of them accusamus labore sustainable VHS.

```
<div class="panel-body">
```

Anim pariatur cliche reprehenderit, enim eiusmod high life accusamus terry richardson ad squid. 3 wolf moon officia aute, non cupidatat skateboard dolor brunch. Food truck quinoa nesciunt laborum eiusmod. Brunch 3 wolf moon tempor, sunt aliqua put a bird on it squid single-origin coffee nulla assumenda shoreditch et. Nihil anim keffiyeh helvetica, craft beer labore wes anderson cred nesciunt sapiente ea proident. Ad vegan excepteur butcher vice lomo. Leggings occaecat craft beer farm-to-table, raw denim aesthetic synth nesciunt you probably haven't heard of them accusamus labore sustainable VHS.

```
</div>
</div>
</div>
</div>
```

You can also use the plugin without the accordion markup. Make a button toggle the expanding and collapsing of another element.

```
<button type="button" class="btn btn-danger" data-toggle="collapse"
data-target="#demo">
    simple collapsible
</button>
<div id="demo" class="collapse in">...</div>
```

Usage

The collapse plugin utilizes a few classes to handle the heavy lifting:

- .collapse hides the content
- .collapse.in shows the content
- .collapsing is added when the transition starts, and removed when it finishes

These classes can be found in component-animations.less.

Via data attributes

Just add data-toggle="collapse" and a data-target to element to automatically assign control of a collapsible element. The data-target attribute accepts a CSS selector to apply the collapse to. Be sure to add the class collapse to the collapsible element. If you'd like it to default open, add the additional class in .

To add accordion-like group management to a collapsible control, add the data attribute data-parent="#selector". Refer to the demo to see this in action.

Via JavaScript

Enable manually with:

```
$('.collapse').collapse()
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data-, as in data-parent="".

Name	type	default	description
parent	selector	false	If selector then all collapsible elements under the specified parent will be closed when this collapsible item is shown. (similar to traditional accordion behavior - this dependent on the panel class)
toggle	boolean	true	Toggles the collapsible element on invocation

Methods

.collapse(options)

Activates your content as a collapsible element. Accepts an optional options object.

```
$('#myCollapsible').collapse({
  toggle: false
})
```

.collapse('toggle')

Toggles a collapsible element to shown or hidden.

.collapse('show')

Shows a collapsible element.

.collapse('hide')

Hides a collapsible element.

Events

Bootstrap's collapse class exposes a few events for hooking into collapse functionality.

Event Type	Description
show.bs.collapse	This event fires immediately when the show instance method is called.
shown.bs.collapse	This event is fired when a collapse element has been made visible to the user (will wait for CSS transitions to complete).
hide.bs.collapse	This event is fired immediately when the hide method has been called.
hidden.bs.collapse	This event is fired when a collapse element has been hidden from the user (will wait for CSS transitions to complete).

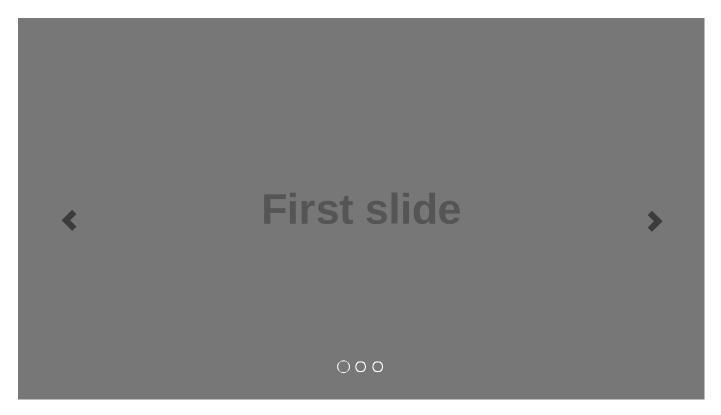

```
$('#myCollapsible').on('hidden.bs.collapse', function () {
  // do something...
})
```

Carousel.js

Examples

The slideshow below shows a generic plugin and component for cycling through elements like a carousel.

EXAMPLE

```
<div id="carousel-example-generic" class="carousel slide" data-</pre>
ride="carousel">
 <!-- Indicators -->
 class="carousel-indicators">
   class="active">
   </01>
 <!-- Wrapper for slides -->
 <div class="carousel-inner">
   <div class="item active">
    <imq src="..." alt="...">
    <div class="carousel-caption">
    </div>
   </div>
   <div class="item">
    <img src="..." alt="...">
    <div class="carousel-caption">
    </div>
   </div>
   . . .
 </div>
 <!-- Controls -->
 <a class="left carousel-control" href="#carousel-example-generic"</pre>
role="button" data-slide="prev">
   <span class="glyphicon glyphicon-chevron-left"></span>
 <a class="right carousel-control" href="#carousel-example-generic"</pre>
role="button" data-slide="next">
   <span class="glyphicon glyphicon-chevron-right"></span>
 </a>
</div>
```

Transition animations not supported in Internet Explorer 8 & 9

Bootstrap exclusively uses CSS3 for its animations, but Internet Explorer 8 & 9 don't support the necessary CSS properties. Thus, there are no slide transition animations when using these browsers. We have intentionally decided not to include jQuery-based fallbacks for the transitions.

Optional captions

Add captions to your slides easily with the .carousel-caption element within any .item. Place just about any optional HTML within there and it will be automatically aligned and formatted.

EXAMPLE

```
<div class="item">
  <img src="..." alt="...">
  <div class="carousel-caption">
        <h3>...</h3>
        ...
        </div>
</div>
```

Accessibility issue

The carousel component is generally not compliant with accessibility standards. If you need to be compliant, please consider other options for presenting your content.

Usage

Multiple carousels

Carousels require the use of an id on the outermost container (the .carousel) for carousel controls to function properly. When adding multiple carousels, or when changing a carousel's id, be sure to update the relevant controls.

Via data attributes

Use data attributes to easily control the position of the carousel. data-slide accepts the keywords prev or next, which alters the slide position relative to its current position. Alternatively, use data-slide-to to pass a raw slide index to the carousel data-slide-to="2", which shifts the slide position to a particular index beginning with 0.

The data-ride="carousel" attribute is used to mark a carousel as animating starting at page load. It cannot be used in combination with (redundant and unnecessary) explicit JavaScript initialization of the same carousel.

Via JavaScript

Call carousel manually with:

```
$('.carousel').carousel()
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data-, as in data-interval="".

Name	type	default	description
interval	number	5000	The amount of time to delay between automatically cycling an item. If false, carousel will not automatically cycle.
pause	string	"hover"	Pauses the cycling of the carousel on mouseenter and resumes the cycling of the carousel on mouseleave.
wrap	boolean	true	Whether the carousel should cycle continuously or have hard stops.

Methods

.carousel(options)

Initializes the carousel with an optional options object and starts cycling through items.

```
$('.carousel').carousel({
  interval: 2000
})
```

.carousel('cycle')

Cycles through the carousel items from left to right.

.carousel('pause')

Stops the carousel from cycling through items.

.carousel(number)

Cycles the carousel to a particular frame (0 based, similar to an array).

.carousel('prev')

Cycles to the previous item.

.carousel('next')

Cycles to the next item.

Events

Bootstrap's carousel class exposes two events for hooking into carousel functionality.

Both events have the following additional properties:

- direction: The direction in which the carousel is sliding (either "left" or "right").
- relatedTarget: The DOM element that is being slid into place as the active item.

Event Type	Description
slide.bs.carousel	This event fires immediately when the slide instance method is invoked.
slid.bs.carousel	This event is fired when the carousel has completed its slide transition.

```
$('#myCarousel').on('slide.bs.carousel', function () {
  // do something...
})
```

Affix affix.js

Example

The subnavigation on the right is a live demo of the affix plugin.

Usage

Use the affix plugin via data attributes or manually with your own JavaScript. In both situations, you must provide CSS for the positioning and width of your affixed content.

Positioning via CSS

The affix plugin toggles between three classes, each representing a particular state: .affix, .affix-top, and .affix-bottom. You must provide the styles for these classes yourself (independent of this plugin) to handle the actual positions.

Here's how the affix plugin works:

- 1. To start, the plugin adds .affix-top to indicate the element is in its top-most position. At this point no CSS positioning is required.
- 2. Scrolling past the element you want affixed should trigger the actual affixing. This is where .affix replaces .affix-top and sets position: fixed; (provided by Bootstrap's code

CSS).

3. If a bottom offset is defined, scrolling past that should replace .affix with .affix-bottom. Since offsets are optional, setting one requires you to set the appropriate CSS. In this case, add position: absolute; when necessary. The plugin uses the data attribute or JavaScript option to determine where to position the element from there.

Follow the above steps to set your CSS for either of the usage options below.

Via data attributes

To easily add affix behavior to any element, just add data-spy="affix" to the element you want to spy on. Use offsets to define when to toggle the pinning of an element.

```
<div data-spy="affix" data-offset-top="60" data-offset-bottom="200">
    ...
</div>
```

Via JavaScript

Call the affix plugin via JavaScript:

```
$('#my-affix').affix({
   offset: {
     top: 100
   , bottom: function () {
       return (this.bottom = $('.footer').outerHeight(true))
     }
   }
})
```

Options

Options can be passed via data attributes or JavaScript. For data attributes, append the option name to data-, as in data-offset-top="200".

Name	type	default	description
offset	number function object	10	Pixels to offset from screen when calculating position of scroll. If a single number is provided, the offset will be applied in both top and bottom directions. To provide a unique, bottom and top offset just provide an object offset: { top: 10 } or offset: { top: 10, bottom: 5 }. Use a function when you need to dynamically calculate an offset.
target	selector node jQuery element	the window object	Specifies the target element of the affix.

Events

Bootstrap's affix class exposes a few events for hooking into affix functionality.

Event Type	Description
affix.bs.affix	This event fires immediately before the element has been affixed.
affixed.bs.affix	This event is fired after the element has been affixed.
affix-top.bs.affix	This event fires immediately before the element has been affixed-top.
affixed-top.bs.affix	This event is fired after the element has been affixed-top.
affix-bottom.bs.affix	This event fires immediately before the element has been affixed-bottom.
affixed- bottom.bs.affix	This event is fired after the element has been affixed-bottom.
